

# Weekly Weather Hazards Assessment

## Central America

1) Field reports indicate that there are significant crop losses in south-central Honduras. The reports also cite that rain totals from the month of June are about half of normal across the highlighted area. The forecast remains mostly dry, with some relief possible on early Sunday.

2) Heavy rain continued along coastal Nicaragua and northeastern Costa Rica. Flood areas continue to be problematic, especially in the hatched region along the major rivers and low-lying areas. Most of the inland showers should diminish in intensity and frequency for the next week, but a tropical wave is forecasted for Saturday and Sunday.
